

ABSTRACT OF THE DISCLOSURE

A monolithic surface mountable monopole antenna. The antenna comprises a top plate having a plurality of conductive regions and a like plurality of legs extending away from a plane of the top plate in a direction of a ground plane. Each leg is disposed between two adjacent conductive regions. In an embodiment wherein the top plate comprises four conductive regions, two of the four legs are connected to an underlying ground plane and two of the legs are connected to a signal feed conductor.
